Stormwater Management Design Manual

City of Newark
Division of Engineering

Newark, Ohio

April 1994

PREFACE

The stormwater design manual is not a text of hydrology or hydraulic design. It assumes that the user has an understanding of hydrology and hydraulic engineering. It does not provide uniform solutions to all drainage problems. Stormwater system design presents an opportunity for the creative and innovative design engineer. The engineer should not be restricted to standardized designs or procedures, nor should the City insist on rigid adherence to a standard set of design specifications. As reflected in the design manual, the emphasis should be on performance.

The design manual provides a uniform design procedure and worksheets for summarizing and submitting the design plans in an acceptable and understandable manner to the City. While the designer is not restricted to these recommended procedures or worksheets, sufficient documentation must be provided with any submission to ensure that methods, procedures, and data are clear.

The design manual provides sufficient information to develop drainage systems in accord with local policy. For a design engineer, such systems begin with the first drop of rainfall and end when the water is safely discharged to receiving waters of adequate capacity.

Rainfall is the first design element to be considered. This phenomenon is basic to the design of stormwater facilities. The design manual outlines the proper use of rainfall information and appropriate data sources relevant to the City of Newark.

The behavior of rainfall on the ground when it becomes runoff is responsive to a number of variables. Watershed area and shape, ground slope, soils, seasons, and impervious areas determine the characteristics of runoff. Conveyance facilities such as streets, storm sewers, culverts, and open channels, need to be used. Sample calculations, acceptable performance standards, and design situations are contained within the design manual.

In order to ensure that the streets do not lose any stormwater carrying capacity due to being resurfaced, the design criteria recommends a policy of maintaining a 5 3/4 inch flow depth at the face of the curb.

Often, temporary storage of stormwater through controlled release is required to meet runoff control requirements. Stormwater runoff storage may be accomplished in many ways. Controlled release of stormwater runoff is the fundamental policy in the design manual (i.e., that the post-development runoff does not exceed the predevelopment runoff). Standards for achieving a controlled release rate are detailed within this design manual.

Drainage is only one part of a complex urban system. Drainage considerations do not have to dominate site development decisions. Yet, drainage does have its place on the site planner's checklist and plays a very important part in the City's role of providing proper health and welfare to its citizens.

TABLE OF CONTENTS

	Page
Preface	ii
Chapter 1. Rainfall	1 - 1
1.1 Rainfall Intensity-Duration-Frequency	1 - 1
1.2 Example - Rainfall Intensity	1 - 1
1.3 Rainfall Distribution by Time	1 - 1
Chapter 2. Stormwater Runoff	2 - 1
2.1 Rational Method (Preferred Method for Drainage Areas Less Than 200 Acres)	2 - 1
2.1.1 Adopted Runoff Coefficients	2 - 1
2.1.2 Composite Runoff Coefficients	2 - 1
2.1.3 Time of Concentration	2 - 1
2.1.4 Example - Rational Method	2 - 2
2.2 Other Methods	2 - 2
Chapter 3. Open Channels	3 - 1
3.1 Selection of Shape	3 - 1
3.2 Design Criteria	3 - 1
3.2.1 Design Storm	3 - 1
3.2.2 Bankful Depth of Flow	3 - 1
3.2.3 Channel Linings	3 - 1
3.2.4 Minimum Bottom Slope	3 - 2
3.3 Design for Steady Uniform Flow	3 - 2
3.3.1 Flow Depth and Velocity	3 - 2
3.3.2 Coefficient of Roughness (n)	3 - 2
3.3.3 Summary of Design Procedures	3 - 2
3.3.4 Example - Roadside Ditch Design	3 - 5
3.4 Floodway Delineation and Regulation	3 - 6
Chapter 4. Streets and Inlets	4 - 1
4.1 Design Criteria	4 - 1
4.1.1 Design Storms	4 - 1
4.1.2 Streets with Curb and Gutter	4 - 1
4.1.3 Gutter Inlets: Continuous Grade	4 - 1
4.1.4 Combination Inlets: Sag or Sump	4 - 2
4.1.5 Maximum Street Spread	4 - 2
4.1.6 Streets with Side Ditch Swales	4 - 2
4.2 General Design Procedures	4 - 2
4.2.1 Gutter Capacity	4 - 3
4.2.2 Capacity of a Grate Inlet or Combination Inlet on Continuous Grade	4 - 3
4.2.3 Example - Capacity of a Grate Inlet on Continuous Grade	4 - 4
4.2.4 Capacity of Grate Inlet or Combination Inlet in Sag or Sump (Water Pounded on Grate)	4 - 5
4.2.5 Capacity of Combination Inlet on Continuous Grade	4 - 6
4.2.6 Capacity of Gutter Inlet or Combination Inlet at Street Intersections	4 - 7

TABLE OF CONTENTS (Continued)

	Page
Chapter 5. Storm Sewers	5 - 1
5.1 Design Criteria	5 - 1
5.1.1 Design Frequency	5 - 1
5.1.2 Depth	5 - 1
5.1.3 Velocity	5 - 1
5.1.4 Time of Concentration	5 - 1
5.1.5 Design Discharge Method	5 - 1
5.1.6 Hydraulic Design	5 - 1
5.1.7 Roughness Coefficients	5 - 1
5.1.8 Manhole Spacing	5 - 2
5.1.9 Conduit Size	5 - 2
5.1.10 Hydraulics at Structures	5 - 2
5.1.11 Location of Sewers	5 - 2
5.2 General Design Procedures	5 - 2
5.3 Major Storm Considerations	5 - 5
Chapter 6. Culverts	6 - 1
6.1 Design Criteria	6 - 1
6.1.1 Design Storm	6 - 1
6.1.2 Maximum Allowable Headwater	6 - 1
6.1.3 Roughness Coefficients	6 - 1
6.1.4 Headwalls	6 - 1
6.2 General Design Procedures	6 - 2
Chapter 7. Channel Protection	7 - 1
7.1 Open Channels	7 - 1
7.2 Culvert Headwalls	7 - 1
7.3 Energy Dissipation	7 - 1
7.4 Example - Energy Dissipation	7 - 1
Chapter 8. Runoff Control Methods	8 - 1
8.1 Design Criteria for Runoff Control	8 - 1
8.2 Detention Structures	8 - 1
8.3 Design Criteria for Detention (Dry) Basins, (Wet) Ponds	8 - 2
8.4 Summary of Design Criteria	8 - 3
8.5 Storage Equation (Preferred Method for Determining the Storage Requirements from a Drainage Area Less Than 10 Acres)	8 - 3
8.5.1 Example - Storage Equation	8 - 4
8.6 Critical Storm	8 - 5
8.7 Graphical Flow Routing (Preferred Method for Determining the Storage Requirement from a Drainage Area Between 10 and 640 Acres)	8 - 6
Chapter 9. Erosion and Sedimentation Control	9 - 1
9.1 Sediment Control	9 - 1
9.2 Long-Term Erosion and Sedimentation Control	9 - 2
9.3 Control of Sloughing, Landsliding, and Dumping	9 - 2

TABLE OF CONTENTS (Continued)

LIST OF TABLES

Table No.	Description	Page
1-1	Total Rainfall Amounts	1 - 1
2-1	Runoff Coefficients for the Rational Method	2 - 1
3-1	Trapezoidal Channels Hydraulic Characteristics	3 - 4
5-1	Manning Roughness Coefficients	5 - 2
8-1	Summary of Design Criteria for On-site Detention/ Retention Structures	8 - 3

LIST OF EXHIBITS

Exhibit No.	Description	Page
I-1	Design Rainfall Intensities	1 - 2
I-2	Rainfall Intensity Equations	1 - 4
II-1	Overland Sheet Flow	2 - 3
II-2	Shallow Concentrated Flow	2 - 4
II-3	Nomograph for Solution of the Manning Formula	2 - 5
III-1	Open Channel Symbols, Equation, and Geometric Formula	3 - 7
III-2	Manning Roughness Coefficients	3 - 8
III-3	Curves for Determining Critical Depth	3 - 9
IV-1	Capacity of Curb Openings Inlets on Continuous Grade	4 - 8
IV-2	Nomograph for Flow in Triangular Channels	4 - 9
IV-3	Capacity of Grate Inlet in Sump	4 - 10
IV-4	Capacity of Curb Opening Inlet at Low Point in Grade	4 - 11
V-1	Nomograph for Solution of the Manning's Formula	5 - 6
VI-1	Inlet Control	6 - 5
VI-2	Culvert Entrance Loss Coefficients	6 - 8
VI-3	Outlet Control	6 - 9
VI-4	Critical Depth Circular Pipe	6 - 11
VI-5	Nomograph for Solution of the Manning Formula	6 - 12
VI-6	Relative Velocity and Flow in Circular Pipe for any Depth of Flow	6 - 13
VII-1	Rock Channel Protection at Culvert and Storm Sewer Outlets	7 - 2
VIII-1	Approximate Detention Basin Routing	8 - 8
IX-1	Straw Bale Ditch Checks	9 - 3

LIST OF FORMS

Form No.	Description	Page
T2-1	Stormwater Runoff Graphical Peak Discharge Computations	2 - 6
T3-1	Open Channel Computations	3 - 10
T4-1	Pavement Drainage Computations	4 - 12
T5-1	Storm Sewer Computations	5 - 7
T6-1	Culvert Size Computations	6 - 14
